

[BESPOKE]

Above, Fabio Signorelli, founder of Edilfare Piscine. One of the services offered by company is the technical support provided by the Pool Consultant, a person with technical expertise who can customise the pool in line with client requests while respecting the requirements of efficient functioning, purification, lighting, cover and heating. Another widely-appreciated plus is the water treatment process, which does not involve the use of chemical agents but is based on ozone and UV light

design, development, restructuring and post-sales maintenance services. Signorelli has also created the exclusive figure of pool consultant, a qualified expert with a thorough knowledge of all design and construction aspects. "I handle this role personally on an international level, so I can provide specialist support alongside the architect and works manager to customise the project in line with client specifications from both an aesthetic and functional-systems point of view".

Edilfare Piscine creates minimal, linear designs but then gives itself free rein with functional features that provide high levels of comfort for those choosing to immerse themselves in the water,

which can run, overflow and create settings that are closely linked to the natural surroundings. "From the point of view of aesthetics, for several years now demand has focussed on dark, extremely clean interior surfaces. Plays of water are a must and the benefit we offer is water treatment. We're one of the few companies to do this in a totally natural way, with technology that makes use of ozone and UV light. We also use mineral salts, especially magnesium and potassium, that recreate the habitat found at hot spas. We make the water pure and neutral without the use of chemical agents". Signorelli says that this green awareness is much appreciated by his clients. www.edilfare.it

MARIE-JOSEPH

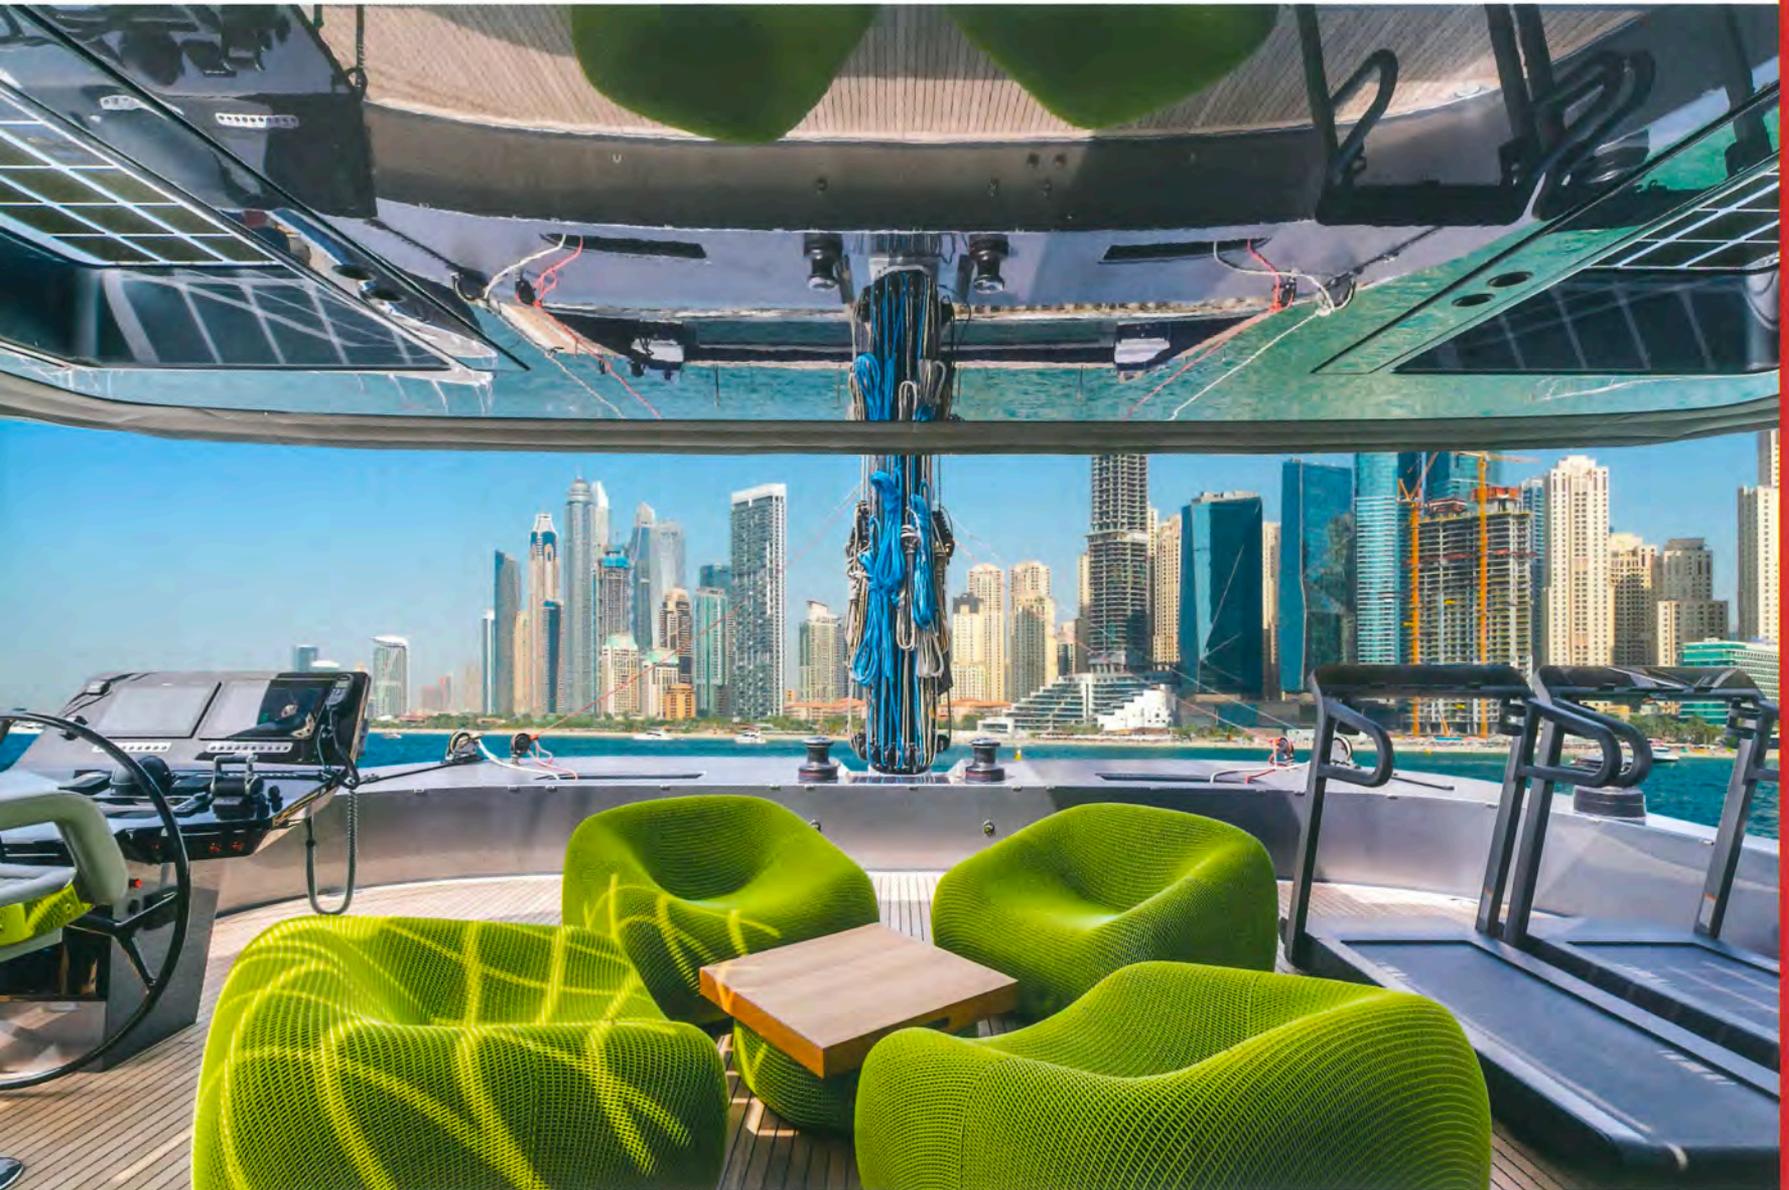

Having already set a standard for the construction of large luxury catamarans, Sunreef Yachts is now leading the charge of the green revolution in yachting. The first Sunreef 80 Eco showcases how the latest sustainable technologies can also enhance onboard comfort. Thanks to a revolutionary solar power system, hydro generation and performance sails, the catamaran offers full autonomy by relying on the sun, water, and wind

On the flybridge, guests can enjoy dining with ocean views or basking in the sun on the large sun pads. There are also treadmills and comfortable lounging chairs

Interior Design

Nicolas Lapp, CTO & Co-Founder Sunreef Yachts

The interiors onboard Marie-Joseph have been designed to be open, universal, and relaxing. This has been achieved through a good consideration and understanding of the layout, but also through the colour palette which is characterised by dark colours. After a long day in the sun, guests can soothe their senses in a cosy environment where grey, beige, and black tones are dominant.

Natural finishing materials and wide-open spaces filled with light and symmetry are the key features of the interior design. The main deck is a perfect example of this approach. Amidships, there is a height-adjustable and modular table

and, to port and starboard, there are two identical oversized lounging sofas. The vast sliding door opens fully onto the aft, so the saloon is semi-open and full of sunlight.

The Sunreef 80 Eco boasts many alfresco and interior lounging and dining options. At the same time, the yacht offers a lot of flexibility – namely thanks to freestanding furniture. Many spaces can be transformed and adapted to various opportunities: cocktails, yoga sessions, conferences, or movie nights. This yacht is meant to be a private retreat when needed, but on many occasions, she turns into the perfect platform for socialising.
